Shopping - Comparing Infield Groomers. What to Look For.

No other manufacturer has this kind of a "Lineup". We make groomers.... that work! Check out all of our groomers on our web site. Every budget and every use.

Don't settle for rough, un-level, hard, weedy and un-playable...... You Can Have

Yes, It's Possible. Smooth isn't enough. Our groomers will level infields too!

Restore & Maintain Infields quickly and easily. Level, grade and smoothen infields for a top quality, safer, playing surface, plus break up hard infields when needed. Remove weeds and deter water puddling. Pull with a variety of tow vehicles. All models adjust quickly without tools.

Our Equipment Works! Heavy Duty - Effective - Affordable

Heying Company Alton, Iowa 51003 Ph. 712-756-8847 Made in USA www.HeyingCompany.com

eving Company Helping Those Who Help Others Play!

Shopping for Infield Groomers? Our "challenge" to you.

Study our infield groomers and compare to the competition. We provide important things to consider and look for when shopping for groomers to prepare and maintain top quality infield surfaces.

Date: 1-1-23

Most Complete Catalogs on the Market. See our web site for info.

We're proud to offer the most choices of "Operator Lift Control Systems" on the market including numerous Choices of Electric Lift.

FREE Financing! Split the cost between two fiscal years?

No fees, no interest financing. I am also willing to discuss other payment terms, or free financing, if it helps you. **Factory Direct Pricing.** Our machines work better and cost less.

Helping Those Who Help Others Play!

Shopping for Infield Groomers? Our "challenge" to you.

If you're shopping for infield groomers we challenge you to look for the correct attributes.

Engineering an effective infield groomer is not easy. Many companies make false claims and misrepresent what their machines do. In general it's not easy for the general public to know the what to look for... until it's too late (after they already own a machine that doesn't work).

Do you know how important the "layers" are of your infields?

Most infields have layers. These layers usually consist of some sort of clay or mixture on top of native soil or whatever else is below. Often the top layer is only 1" to 3" deep. Do you know how deep your top layer is? Is the top layer a consistent depth? It might not be. Infield layers are expensive to create. Any tool (i.e. subsoiling blades) or machine used on an infield that disturbs or mixes these layers will ruin the infield. In other words... if you mix them together you can't get them back.

What does an infield need? Level AND Smooth.

Level and Smooth are the first two functions a machine must perform for infields. If a machine can't do both then it shouldn't be called an infield groomer. Making an infield smooth is easy. This can be done with a variety of tools..... drag mats, brooms, we often say "even a bed mattress will do it".

Leveling on the other hand is a whole different matter and is not easy to engineer. We've mastered the "leveling" function with numerous machine models. Our leveling implements all "lock in place" where you set them and they stay there. So as they are pulled over the infield the locked device grades off high areas and fills low areas. As you shop look closely and ask yourself what specific implements does the machine you're looking at have that is making the infield "level"?

Subsoiling Blades do not level....and they could ruin an infield.

Machines with subsoiling blades were generally designed for horse arenas. They are very risky on infields. And subsoiling blades do not level. Horses may not require their arena to be level. Infields on the other hand should be. Using any tool or machine that disturbs infield layers is risky.

Floating implements "do not level".

We use some floating implements on our groomers such as rear smoothing brooms and drag mats. BUT, they only follow other implements on our machines that do the leveling. Floating implements do help smoothen an infield. But they simply do not level. There are many machines on the market that employ "floating implements" and / or "subsoiling blades".

Spring Tines "do not level".

We employ the use of spring tines on our groomers. They can help pulverize the top portion of infields. But our tines are mounted ahead of our "leveling" implements…they are not used to level.

Drag Mats only smoothen - they do not level even if they are rigid and have a so called leveling bar. They still float and do not level. Since they float the so called leveling bar does not cut high areas and fill low areas. These are necessary in order to level.

Bunker Rakes do not level.

These machines are specifically designed to smoothen golf course bunkers. Golf courses do not want their bowl shaped bunkers to be level. They only want to smoothen them. Just because companies say bunker rakes can be used on ballfield infields doesn't mean they level the infield! They only smoothen it. Their implements float so simply cannot level properly.

What other needs do infields have?

There are other things an infield might need in addition to level and smooth. One example: Pulverizing. Infields sometimes get very hard and need to be broken up. But only the top portion. Implements used for this are often called "scarifiers". Even though Spring Tines work to some degree to break up hard fields, hard steel teeth are more effective. If you have sand mixture in your top infield layer then you've seen how hard they get. We offer steel tooth and spring tine scarifiers.

Happy Shopping. We hope to hear from you when you decide you want your infields "level and smooth".

Shopping - Comparing Infield Groomers. What to Consider

Things to consider when shopping.

What Sets Our Groomers Apart!

When shopping / comparing consider:

1- We sell "factory direct". Saves you important budget dollars.

From our centrally located factory in Iowa we not only serve the US but also Canada - and, yes, we ship world-wide.

- 2- Compare cost and you will discover our prices are below the competition and our equipment is better.
- 3- We are the first to ever design an electric lift infield groomer.
- **4– We are the first to ever design a true "wireless remote control" electric lift system** and our system is completely weather proof the only one on the market.
- 5– We are the first to ever to design a leveling device that cuts / grades 100% of the surface that it's grooming (see the "leveler implement on the Pro Groomer PR72).
- 6- We are the only manufacturer to put No Air No Flat Wheels on groomers.

We will not put air tires on groomers. We are the only manufacturer who considers the nuisance that flat or uneven air wheels cause. That's why we never sell a machine with air wheels. Un-even wheels cause leveling problems and many customers don't have an air supply at ball fields. Small air wheels are notorious for losing air quickly and require constant attention. Even customers who do have air supply appreciate that our wheels require no air and won't go flat.

- 7- Our Groomers DO Level. It's not enough to just smoothen infields. Many devices will smoothen but it's much harder to design machines that "Level" too. All of our groomers level. Floating devices, or Implements, that don't lock into position Do Not Level! Our groomers have implements that "lock-in" to position to level properly.
- 8- More Operator Lift Control Systems to choose from. And our systems work!

Including the only "WR" Wireless Remote Control System on the market.....our new "PW" Portable Wireless Control System introduced in 2019, and our NEW 2022 "SG" Corded System.

- **9– Special square drive on gear case of electric actuator.** We're the only manufacturer who has a special exposed square shaft drive on the outer gearcase of the actuator. Why does this matter? In an emergency such as dead battery or other electrical issue our actuator can be hand operated to lift or lower the machine. This manual capability allows operation of the groomer even if the electric lift has an issue. Gets you out of a pinch when needed.
- **10– No Tools Needed to Adjust engineering.** No other company offers this for all adjustments to all implements.
- 11- Level Mix Smoothen (all are necessary for optimal infields. Most other machines only smoothen).
- 12- Greatly Reduce the Need for Hand Raking
- 13- Pulverize / Break up hard infields (check out our Chisel Scarifier for pulverizing hard infields).
- 14- Maintain a safer playing surface
- 15- Deter water puddling
- 16- Remove Weeds before the season and control weeds during the season.
- 17- Heavy Duty Steel Construction. Our machines are heavy duty.
- 18- Powder Coated finish
- **19– Pull with a variety of towing machines.** Garden Tractors, ATV's, UTV's, etc.
- 20- Work on all infield materials
- 21- Easy to Use
- **22– Affordable.** Many competitor groomers do less and cost more.
- 23– Greatly Reduce Prep Time Preparing Infields before and during the season.
- 24– 36 Month Limited Warranty. No better warranty in the Business.

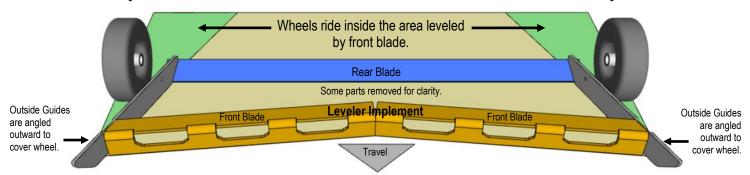

We could go on with this list. Hope we've made our point. Compare to other groomers.

Infields Need to be Smooth and Level!

Making an infield smooth is relatively easy. Leveling them requires a much higher degree of engineering.

Important Features that Sets our PR72 Pro Groomer Apart

Blades cut 100% of the surface while grooming.

Unlike other machines our Pro Groomer leveling blades cut 100% of the surface. Does not leave areas un-cut.

As the Front Blades Level the Wheels Ride "inside the cut area" towards the ends of the Leveler.

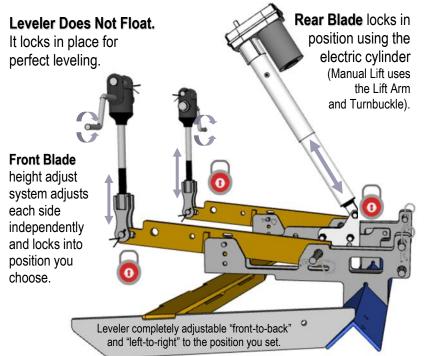

This creates a smooth path for the groomer for improved leveling.

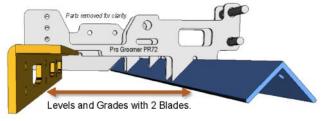

Two Blades level better than one.

Pro Groomer Leveler Implement "Locks Into Position" to Level.

Floating Implements, such as steel drag mats, simply cannot level an infield. They might help smoothen but they ride up over high areas (don't cut it off) and sink down into low areas (tend to drag material out).

In order for an implement to level it must "Lock into Place" and not float. Our Leveler Implement travels over material and cuts high areas, carries material along, and releases it into low areas.

The PR72 Pro Infield Groomer is Engineered to Level.

Leveler Implement + Adjustment System produces "Level" and "Smooth" Infields.

Leveler Does Not Float! Each side of the front blade adjusts independently to keep the implement level left to right and to adjust the height of the front blade. The rear blade adjusts and locks into position using the rear electric cylinder (Manual Lift uses the Lift Arm and Turnbuckle to adjust rear blade).
